

Import Data using Transform Maps in ServiceNow

1. Brainstorming & Ideation Phase

Project Title

Import Data using Transform Maps in ServiceNow

Problem Statement

Organizations frequently maintain employee or operational data in spreadsheets (Excel/Google Sheets). Manually entering this data into enterprise systems like ServiceNow is time-consuming, error-prone, and difficult to scale as data volume grows. There is a need for an automated, repeatable, and reliable method to bring external spreadsheet data into ServiceNow while avoiding duplicate records and maintaining data accuracy.

Idea / Proposed Solution

Use ServiceNow's built-in Import Set and Transform Map framework to:

- Upload spreadsheet data directly into a staging (Import Set) table.
- Map the staged data to a target custom table using a Transform Map.
- Use Coalesce fields to prevent duplicate record creation on repeated imports.
- Visualize the imported data using Reports and a Dashboard for quick insights.

Why This Approach?

Approach	Pros	Cons
Manual Data Entry	Simple for very small data	Slow, error-prone, not scalable
Custom Script/API Integration	Fully automatable	Requires scripting knowledge and longer development time
Import Set + Transform Map (Chosen)	No-code/low-code, built into ServiceNow, reusable, supports coalesce and scheduled imports	Requires understanding of ServiceNow data model

Key Objectives

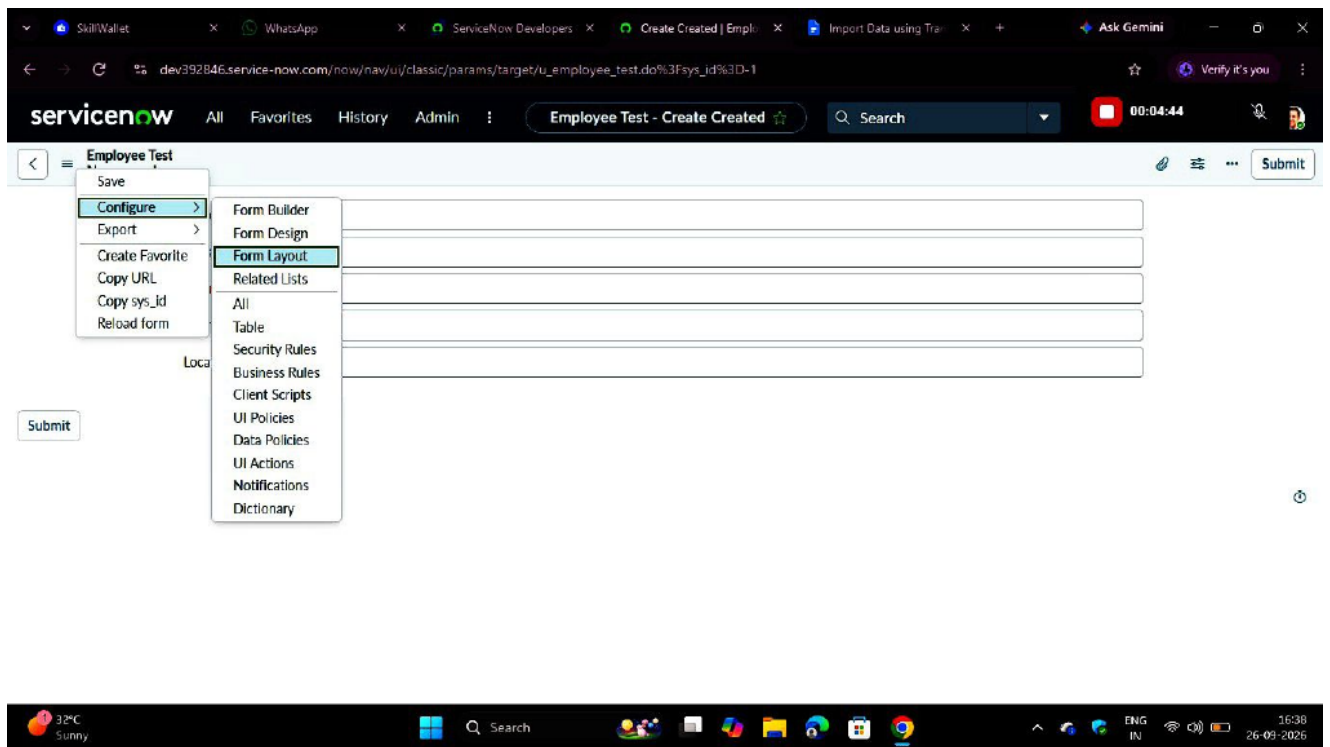

- Automate employee data import from Excel into ServiceNow.
- Prevent duplicate records on repeated imports.
- Support incremental updates (new + modified records).
- Provide visual reports and a dashboard for data insights.

Target Users

- HR/Admin teams who regularly update employee master data.
- ServiceNow administrators managing data migrations.

Expected Outcome

A working ServiceNow instance where employee data can be imported from an Excel file at any time, existing records get updated (not duplicated), new records get inserted, and the results are visible through reports and a dashboard.
