

Import Data using Transform Maps in ServiceNow

2. Requirement Analysis Phase

Functional Requirements

ID	Requirement
FR-01	System shall allow uploading of an Excel (.xlsx) file containing employee data
FR-02	System shall stage uploaded data in an Import Set table
FR-03	System shall map staged data to a target custom table using a Transform Map
FR-04	System shall auto-map fields with matching names
FR-05	System shall support manual field mapping for unmatched fields
FR-06	System shall prevent duplicate records using a Coalesce field (Employee ID)
FR-07	System shall support re-import of the same file with updated/new rows
FR-08	System shall display import results (inserted, updated, ignored counts)
FR-09	System shall generate reports (Pie chart, Bar chart, List view) from imported data
FR-10	System shall display all reports on a single dashboard

Non-Functional Requirements

- Data accuracy must be maintained after every import.
- Import process should be repeatable without manual cleanup.
- Reports must reflect real-time data from the target table.
- Solution must be usable by non-technical staff after initial setup.

Data Requirements

- Employee ID (unique identifier, used for coalesce)
- Employee Name
- Email
- Department
- Location

Tools & Platform Used

- ServiceNow instance (Personal Developer Instance / PDI)
- Google Sheets for preparing sample employee data
- Microsoft Excel format (.xlsx) as the import file format

Assumptions

- Employee ID is unique per employee and never changes.
- The Excel file structure (column order and headers) remains consistent across imports.

Constraints

- Import Set tables have a row limit per load depending on instance configuration.
- Field types in source and target tables should be compatible (String types used here for simplicity).

ServiceNow form titled "Employee Test - Create Created" showing the following fields:

- Employee ID
- Employee Name
- Email
- Department
- Location

A "Submit" button is located at the bottom left of the form.
