

Import Data using Transform Maps in ServiceNow

3. Project Design Phase

System Architecture / Data Flow

Google Sheet: Employee Data

↓ Download as .xlsx

Excel File

↓ Load Data / Import Set

Import Set Table: Employee Import (u_imp_employee_import)

↓ Transform Map: Sample Spreadsheet Import

Target Table: Employee Test (u_employee_test)

↓

Reports: Pie Chart | Bar Chart | List View

↓

Employee Analytics Dashboard

Custom Table Design — u_employee_test (Employee Test)

Field Label	Field Name	Type	Notes
Employee ID	u_employee_id	String	Used as Coalesce field (unique key)
Employee Name	u_employee_name	String	Full name of employee
Email	u_email	String	Employee email address
Department	u_department	String	Department name
Location	u_location	String	Work location

Import Set Table Design — Employee Import

The Import Set table is the auto-generated staging table created by ServiceNow when Load Data is used. Its columns mirror the Excel sheet headers (Employee ID, Name, Email, Department, Location) with a u_ prefix.

Transform Map Design

Transform Map Name	Source Table	Target Table
Sample Spreadsheet Import	Employee Import	Employee Test

Field Mapping (Source → Target)

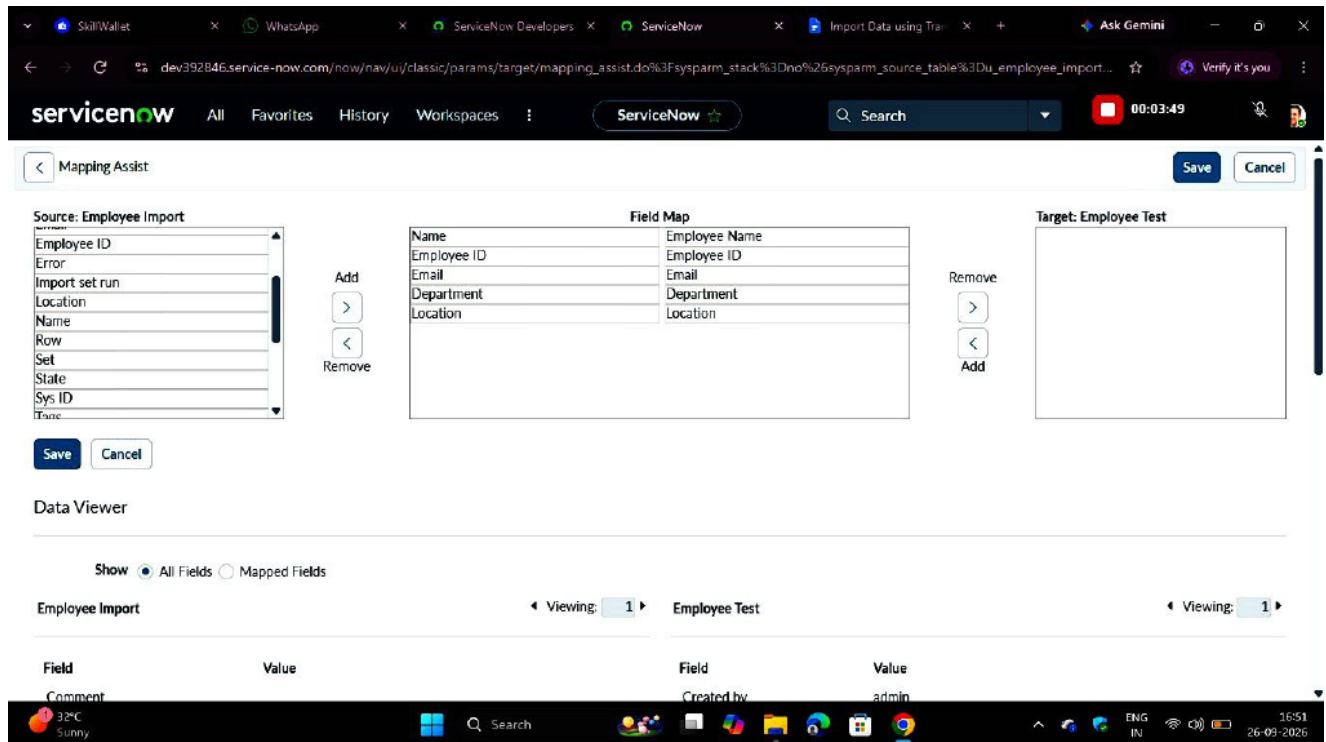

Source Field	Target Field	Coalesce
Employee ID	Employee ID	Yes
Name	Employee Name	No
Email	Email	No
Department	Department	No
Location	Location	No

UI / Screen Design

- Load Data screen: File upload widget with sheet number and header row inputs.
- Employee Test table view: Standard ServiceNow list view showing all imported records.
- Dashboard: Three widgets (Pie chart, Bar chart, List) arranged on a single dashboard page.

Design Rationale

Coalescing on Employee ID ensures the system recognizes an existing employee on re-import and updates their record instead of creating a duplicate — this was the central design decision for data integrity.
