

Import Data Using Transform Maps(Spreadsheet)

Phase 7: Project Documentation

Introduction

Organizations often maintain critical data such as employee records in spreadsheets. Manually transferring this data into enterprise platforms like ServiceNow is inefficient and prone to errors. This project demonstrates how to use ServiceNow's Import Set and Transform Map framework to automate the import of employee data from an Excel spreadsheet into a ServiceNow custom table, with duplicate prevention and reporting capabilities

Objective

- Automate import of employee data from Excel into ServiceNow.
- Prevent duplicate records using Coalesce.
- Support incremental updates on subsequent imports.
- Visualize data through reports and a dashboard.

Tools & Technologies Used

- ServiceNow (Personal Developer Instance)
- Google Sheets (data preparation)
- Microsoft Excel (.xlsx) format
- ServiceNow modules: System Import Sets, Transform Maps, Reports, Performance Analytics Dashboards

System Design

The system is designed to import employee data from an Excel/CSV file into ServiceNow using an Import Set and Transform Map. The imported data is mapped to the Employee Test table using fields such as Employee ID, Employee Name, Email, Department, and Location. Coalesce is used to identify existing records and prevent

duplicate entries. The transformed data is then used for reports and analytics dashboards.

- Data Flow: Excel/CSV File → Import Set → Transform Map → Employee Test Table → Reports → Analytics Dashboard
- The custom table u_employee_test stores Employee ID, Employee Name, Email, Department, and Location.
- Employee ID is used as the Coalesce field to uniquely identify records across imports.

Implementation Steps

1. Data Preparation: Sample employee data created in Google Sheets and exported as .xlsx .
2. Custom Table Creation: Employee Test table created with required fields.
3. Import Set Configuration: Data loaded via Load Data, creating the Employee Import staging table.
4. Transform Map Setup: Sample Spreadsheet Import Transform Map created, fields auto-mapped and verified.
5. Transform Execution: Data transformed from the Import Set into Employee Test verified in the target table.
6. Coalesce Configuration: Employee ID field set to Coalesce = true to prevent duplicates.
7. Re-import Testing: Updated spreadsheet (2 modified + 2 new rows) re-imported and transformed; Transform History confirmed correct insert/update behavior.
8. Reporting: Three reports created — Employees by Department (Pie chart) Employees by Location (Bar chart) Employee
- 9.. Dashboard Creation: Employee Analytics Dashboard created and all three reports added and arranged

The screenshot displays the ServiceNow Employee Analytics Dashboard, showing a table of employee data. The table has five columns: Employee ID, Employee Name, Department, Email, and Location. The data row shows an employee with ID SB0004, name user4, working in the ServiceNow department, with email user4@gmail.com, located in Tamil nadu. The Windows taskbar at the bottom shows the date as 26-09-2026 and the time as 20:31.

Employee ID	Employee Name	Department	Email	Location
SB0004	user4	ServiceNow	user4@gmail.com	Tamil nadu

Results

The system successfully imported employee data, updated existing records without duplication, inserted new records on subsequent imports, and displayed accurate analytics through reports and a dashboard.

Challenges Faced

- Ensuring auto-mapped fields were correctly aligned with target fields (some required manual correction via Mapping Assist).
- Understanding Coalesce behavior and confirming it worked as expected through repeated import testing.
- Backend configuration needed for dashboard sharing (ACL override on pa_dashboards table in some instances).

Future Enhancements

- Schedule automatic imports at fixed intervals.
- Add data validation scripts (e.g., email format checks) in the Transform Map.
- Extend to support additional data sources (CSV, API-based feeds)

Conclusion

This project demonstrates a practical, no-code approach to automating data migration in ServiceNow using Import Sets and Transform Maps. The approach is reusable for any spreadsheet-based data import scenario and can be extended with scheduled imports, data transformation scripts, and more advanced reporting.
