Video Script / Structure

1. Introduction

This project demonstrates how employee data can be imported into ServiceNow using Transform Maps. The project uses a spreadsheet containing employee information and imports the data into a custom Employee Test table.

The main fields used in the project are:

- Employee ID
- Name
- Email
- Department
- Location

The project also demonstrates data mapping, transformation, duplicate prevention using Coalesce, reporting, and dashboard creation.

2. Purpose of the Project

The purpose of this project is to simplify the process of importing employee information into ServiceNow. Manual data entry can take more time and may result in incorrect or duplicate records. By using Import Sets and Transform Maps, employee data can be imported from a spreadsheet into the required ServiceNow table.

The project aims to:

- Import employee data from a spreadsheet.
- Create a custom Employee Test table.
- Map spreadsheet fields with ServiceNow table fields.
- Transform and store employee records.
- Prevent duplicate records using Employee ID as the Coalesce field.
- Generate reports and visualize the imported data through a dashboard.

3. Benefits of the Project

The project provides the following benefits:

- Saves time: Employee records can be imported together instead of entering them manually.
- Reduces errors: Field mapping helps transfer data consistently.
- Prevents duplicates: The Employee ID is used as a Coalesce field.
- Easy data management: Imported employee information can be maintained in the Employee Test table.
- Reusable process: The same Transform Map can be used for future employee data imports.
- Data visualization: Reports and dashboards provide a clear view of employee information.

4. Project Execution / Working Process

Step 1: Creation of Spreadsheet

- First, a spreadsheet is created to store the employee information.
- The spreadsheet contains fields such as:

Employee ID	Name	Email	Department	Location
SB0001	User1	user1@gmail.com	ServiceNow	Tamilnadu

Sample employee records are entered into the spreadsheet.

Screenshot:

Employee ID	Name	Email	Department	Location
SB0001	user1	user1@gmail.com	ServiceNow	Tamil nadu
SB0002	user2	user2@gmail.com	ServiceNow	Tamil nadu
SB0003	user3	user3@gmail.com	ServiceNow	Tamil nadu
SB0004	user4	user4@gmail.com	ServiceNow	Tamil nadu
SB0005	user5	user5@gmail.com	Salesforce	Tamil nadu
SB0006	user6	user6@gmail.com	Salesforce	Tamil nadu

Step 2: Creation of Employee Test Table

- A custom table named Employee Test is created in ServiceNow.
- The table is used as the target table for storing the imported employee records.
- The required fields are created in the table, including:
 - Employee ID
 - Name

- Email
- Department
- Location

Screenshot :

Employee ID	Employee Name	Department	Email	Location
SB0004	user4	ServiceNow	user4@gmail.com	Tamil nadu
SB0005	user5	Salesforce	user5@gmail.com	Tamil nadu
SB0001	user1	ServiceNow	user1@gmail.com	Tamil nadu
SB0003	user3	ServiceNow	user3@gmail.com	Tamil nadu
SB0001	user1	ServiceNow	user1@gmail.com	Tamil nadu
SB0002	user2	ServiceNow	user2@gmail.com	Tamil nadu
SB0002	user2	ServiceNow	user2@gmail.com	Tamil nadu
SB0003	user3	ServiceNow	user3@gmail.com	Tamil nadu
SB0006	user6	Salesforce	user6@gmail.com	Tamil nadu
SB0006	user6	Salesforce	user6@gmail.com	Tamil nadu
SB0004	user4	ServiceNow	user4@gmail.com	Tamil nadu
SB0005	user5	Salesforce	user5@gmail.com	Tamil nadu

Step 3: Load Data

- The spreadsheet data is uploaded into ServiceNow using the Load Data option.
- The uploaded spreadsheet creates an Import Set containing the employee data.
- The Import Set acts as temporary staging data before the information is transformed into the target Employee Test table.

Screenshot :

Step 4: Create Transform Map

- A Transform Map is created to transfer data from the Import Set to the Employee Test table.
- The Transform Map connects the source fields with the corresponding target fields.

Field Mapping:

Source Field	Target Field
Employee ID	Employee ID
Name	Employee Name
Email	Email ID
Department	Department
Location	Location

This mapping ensures that each spreadsheet field is stored in the correct field of the Employee Test table.

Screenshot to include:

The screenshot shows the 'Table Transform Map - New Record' form in the ServiceNow interface. The form is titled 'Table Transform Map - New Record' and includes a 'Submit' button. The form fields are as follows:

- Name:** Sample Spreadsheet Import
- Source table:** Employee Import [u_employee_im...]
- Active:** ☒
- Run business rules:** ☒
- Enforce mandatory fields:** No
- Copy empty fields:** ☐
- Create new record on empty coalesce fields:** ☐
- Application:** Global
- Created:** (empty field)
- Target table:** Employee Test [u_employee_test]
- Order:** 100
- Run script:** ☐

Below the form, there is a 'Submit' button and a 'Related Links' section with the following links:

- [Auto Map Matching Fields](#)
- [Mapping Assist](#)

The bottom of the screenshot shows the Windows taskbar with the date and time: 15:49, 26-09-2026.

Step 5: Run the Transform

- After creating the Transform Map and field mappings, the transform process is executed.
- The employee information from the Import Set is transferred into the Employee Test table.
- The transformation status is checked to confirm that the records are successfully processed.

Screenshot :

Step 6: Configure Coalesce

- The Employee ID field is configured as the Coalesce field in the Transform Map.
- Coalesce is used to identify an existing record during the import process.
- If the Employee ID already exists, the existing record can be updated instead of creating another duplicate record.
- Therefore, Employee ID acts as a unique identifier for the employee records.

Screenshot :

Step 7: Re-import Employee Data

- The spreadsheet is modified to test the update and insert functionality.
- Existing employee records are modified and new employee records are added.
- The updated spreadsheet is imported again into ServiceNow.
- Because Employee ID is used as the Coalesce field:
- Existing Employee IDs are updated.
- New Employee IDs are inserted as new records.
- Duplicate records are avoided.
- The Transform History is checked to verify the number of inserted and updated records.

Screenshot :

5. Reports and Dashboard

After successfully importing the employee data, reports are created using the Employee Test table.

Report 1: Pie Chart

- A pie chart is created to represent employees based on their Department.
- This provides a visual representation of the distribution of employees among different departments.

Screenshot :

Report 2: Bar Chart

- A bar chart is created to provide another visual representation of the employee data.
- The chart helps to compare the employee information in a simple graphical format.

Screenshot :

Report 3: List View

- A list report/view is created to display the employee records in tabular form.
- It provides details of the employee records stored in the Employee Test table.

Screenshot :

6. Employee Analytics Dashboard

- A dashboard named Employee Analytics Dashboards is created in ServiceNow.
- The created reports are added to the dashboard so that employee information can be viewed from a single screen.
- The dashboard contains visualizations such as:

Pie Chart

Bar Chart

Employee List / Report

- The dashboard provides a centralized view of the imported employee information.

Screenshot :

7. Final Output

The final output of the project is a successfully populated Employee Test table containing the imported employee records.

The project demonstrates:

1. Spreadsheet creation.
2. Employee Test table creation.
3. Loading spreadsheet data into ServiceNow.
4. Import Set creation.
5. Transform Map creation.
6. Field mapping.

7. Employee ID Coalesce configuration.
8. Successful data transformation.
9. Insert and update operations.
10. Transform History verification.
11. Report creation.
12. Employee Analytics Dashboard creation.

8. Conclusion

The project successfully demonstrates how ServiceNow Transform Maps can be used to import employee data from a spreadsheet into a custom ServiceNow table.

The use of field mapping and Employee ID as a Coalesce field helps manage existing and new employee records during repeated imports. Finally, reports and the Employee Analytics Dashboard provide a clear visual representation of the imported employee data.

Thus, the project provides a complete workflow for employee data import, transformation, duplicate prevention, reporting, and visualization in ServiceNow.

Recording Checklist

- ☐ Screen recording software ready (OBS Studio / Loom / Zoom)
- ☐ Microphone tested for clear voice-over
- ☐ ServiceNow instance and Google Sheet open before recording starts
- ☐ Video reviewed for clarity before uploading
- ☐ Uploaded to Google Drive with public "Anyone with the link" access
- ☐ Link tested in an incognito/private browser window to confirm public access

Verification Checklist:
